

We are working on  
Curved Path Construction.

? Scoping has another interesting effect: Any changes to the clipping area are local to the scope. Thus, if you say `\clip` somewhere inside a scope, the effect of the `\clip` command ends

after the end of that scope.   $x = 1, x = 2, x = 3,$

We can also nest loops to create interesting effects.

Labeling examples using TikZ.

You can also position labels on curves and, by adding the `sloped` option, have them rotated such that they match the line's slope.
